MasterClass: TP

Chapters 2 & 3: My KBank - back office

kbrw

Goal

Create a simple admin interface

Now that we have a service allowing us to handle some bank accounts, it would be nice to have an administration interface to manage them. These chapters are more about plug and jsxz, but if you're willing to use EWM, do it.

What we want :
- An *extremely* simple authentication. No user management is needed, just one password to rule them all in a header.
  It is important to protect all your webservices with a dedicated plug, giving a 401 if the password is not provided in the right header.

- A simple interface listing all the accounts with some actions connected to CRUD APIs
  You have to implement these functionalities :
  - a POST to edit balance/name.
  - a GET to retrieve all account information
  - a DELETE to remove an account

- Feel free to add any relevant information in these WS (last update date for example)

You can keep design as simple as possible (a simple form and some raw tables on a blank page are ok) : that's not the purpose of this exercise. However, feel free to custom your css if you want.
